

How to track

Login and Logout

Activity In Django

#pythonworld

Introduction..

In this post we are going to see how we can **track login and logout activity** for an user in our django application.

1. Install the package

We need to install `dj-user-login-history` package by just hitting this command in terminal

code

```
pip install dj-user-login-history
```

2. Add in installed apps

open settings.py file and add
`login_history` in `installed_apps`.

code

```
settings.py

INSTALLED_APPS = [
    ...
    'login_history',
    ...
]
```

3. Migrate Database

Simply hit the migrate command to migrate the database.

code

```
python manage.py migrate
```

4. Create superuser

Simply hit this command to createsuperuser.

..... code

```
python manage.py createsuperuser
```

5. Open django admin

Open django admin and here you can see the tables, under login_history app.

Every time, if you login and logout, all your records will get store in the table.
